

Service Planning & Budgeting

Week 1

Use appropriate techniques to prepare and lead a planning process to create a service in HSCM system

Learning Outcomes

At the end of the session the learner should be able to understand the

The service planning process

- What it is and how to start the process.
- Different planning formats.
- Planning techniques to assist in service analysis, direction setting and implementation.
- Planning for health improvement.
- Joint planning and collaboration with other services.
- Managing stakeholders and evaluation

Why plan a health care service?

CLASS DISCUSSION

Why is it important to plan health care services??

Definition

Service planning in HSC describes the steps taken by health planners to move the service(s) of an entity, network or organisation into its desired future state.

The context of service planning can be for an individual service, multiple services, a single organization, a network of organizations or a complete health system. It is modifiable to the different requirements of each, and may include.

- New services
- Existing services requiring improvement
- Services being considered for a recurrent or one-off investment
- Services being impacted by a capital investment exercise

What is the service planning process?

Healthcare providers aim to make their communities healthier by providing safe, effective and sustainable health services.

- It is essential that health services are well planned and organised, and based on a community's and its healthcare providers' needs.
- Services must evolve in line with cultural expectations, changing practice and technological advancement.
- The planning process aims to ensure that health services align and adapt to changing patterns of health needs while making the most effective use of available resources

Factors to be addressed in Service Planning

- The need for services
- Resources and capacity to deliver services
- Suitability and functionality of existing services
- Resource gaps and requirements
- Facilities and equipment to support service delivery
- Organizational arrangements and management
- Capital and recurrent resources and costs of the service
- Benefits expected from the delivery of services
- New or additional investment requirements

Health service plans address the following questions:

- How is the health service currently being delivered and how should it be delivered in the future? (**Situational Analysis**)
- What is the service you are planning for? Why is it necessary? **Rationale or Justification**
- Who is the health service for and where is it located? - **Which community and people would benefit from the service**
- What does the service want to achieve (**Service Outcomes**) - **What are its objectives?**
- What resources does the health service currently use and require in the future for the proposed service? **Budgeting**
- When will the proposed service be delivered? **Time frame for service delivery**

A systematized approach to the Inputs, Processes and Outputs of Service Planning

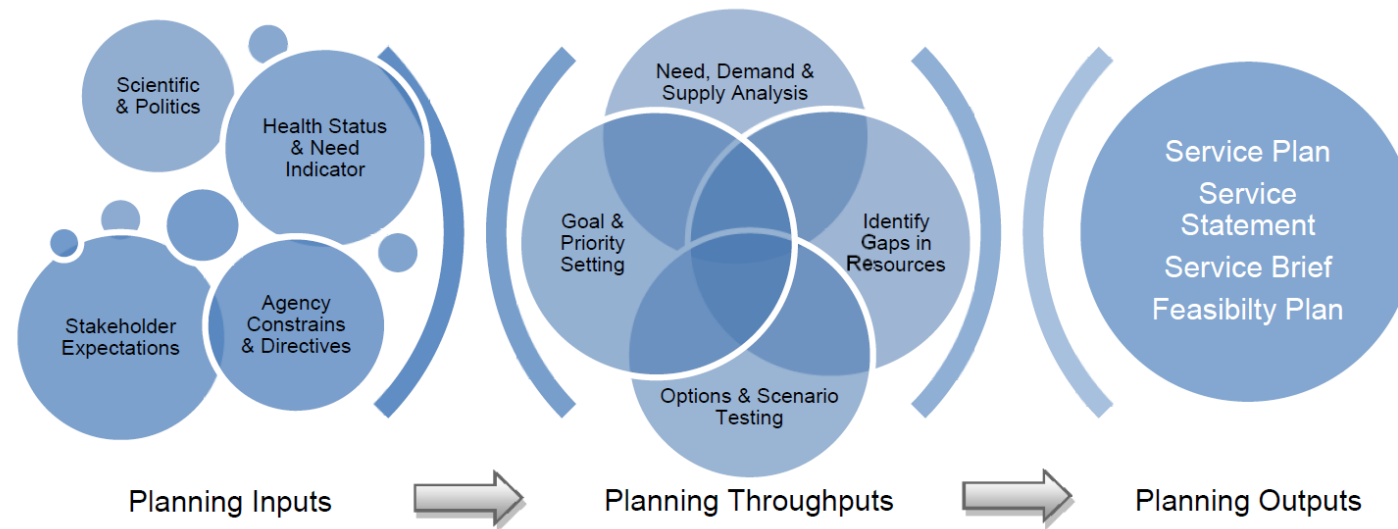

Figure 2 Approaches to planning inputs, throughputs and outputs

Planning inputs: Information and data about the service catchment, Population, Socioeconomic and Health Status and Health Needs. Information is gathered by Population Surveys, Actively Engaging Stakeholder Groups, Holding Community Forums and Public Meetings.

Planning throughputs: Analysis of Health Needs, Demand and Supply, Identification of Gaps in Services, Goal and Priority setting and Resource Assessment.

Planning outputs: formulated into a document that serves to guide the subsequent investment, Design and Implementation process.

Summary of the Service Planning Process

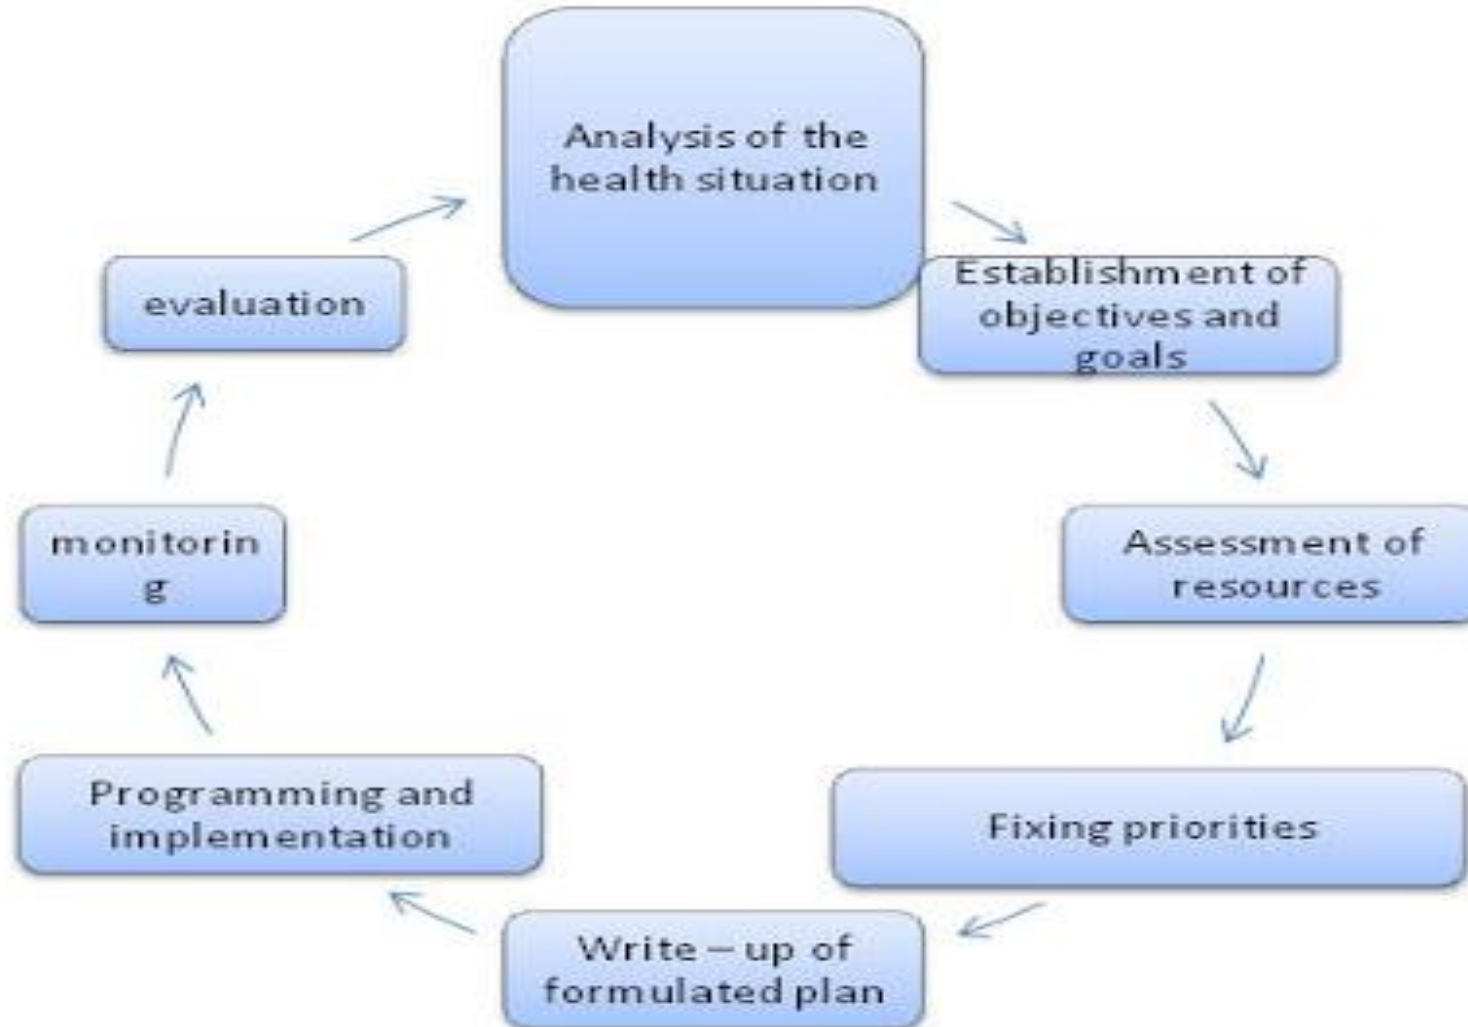

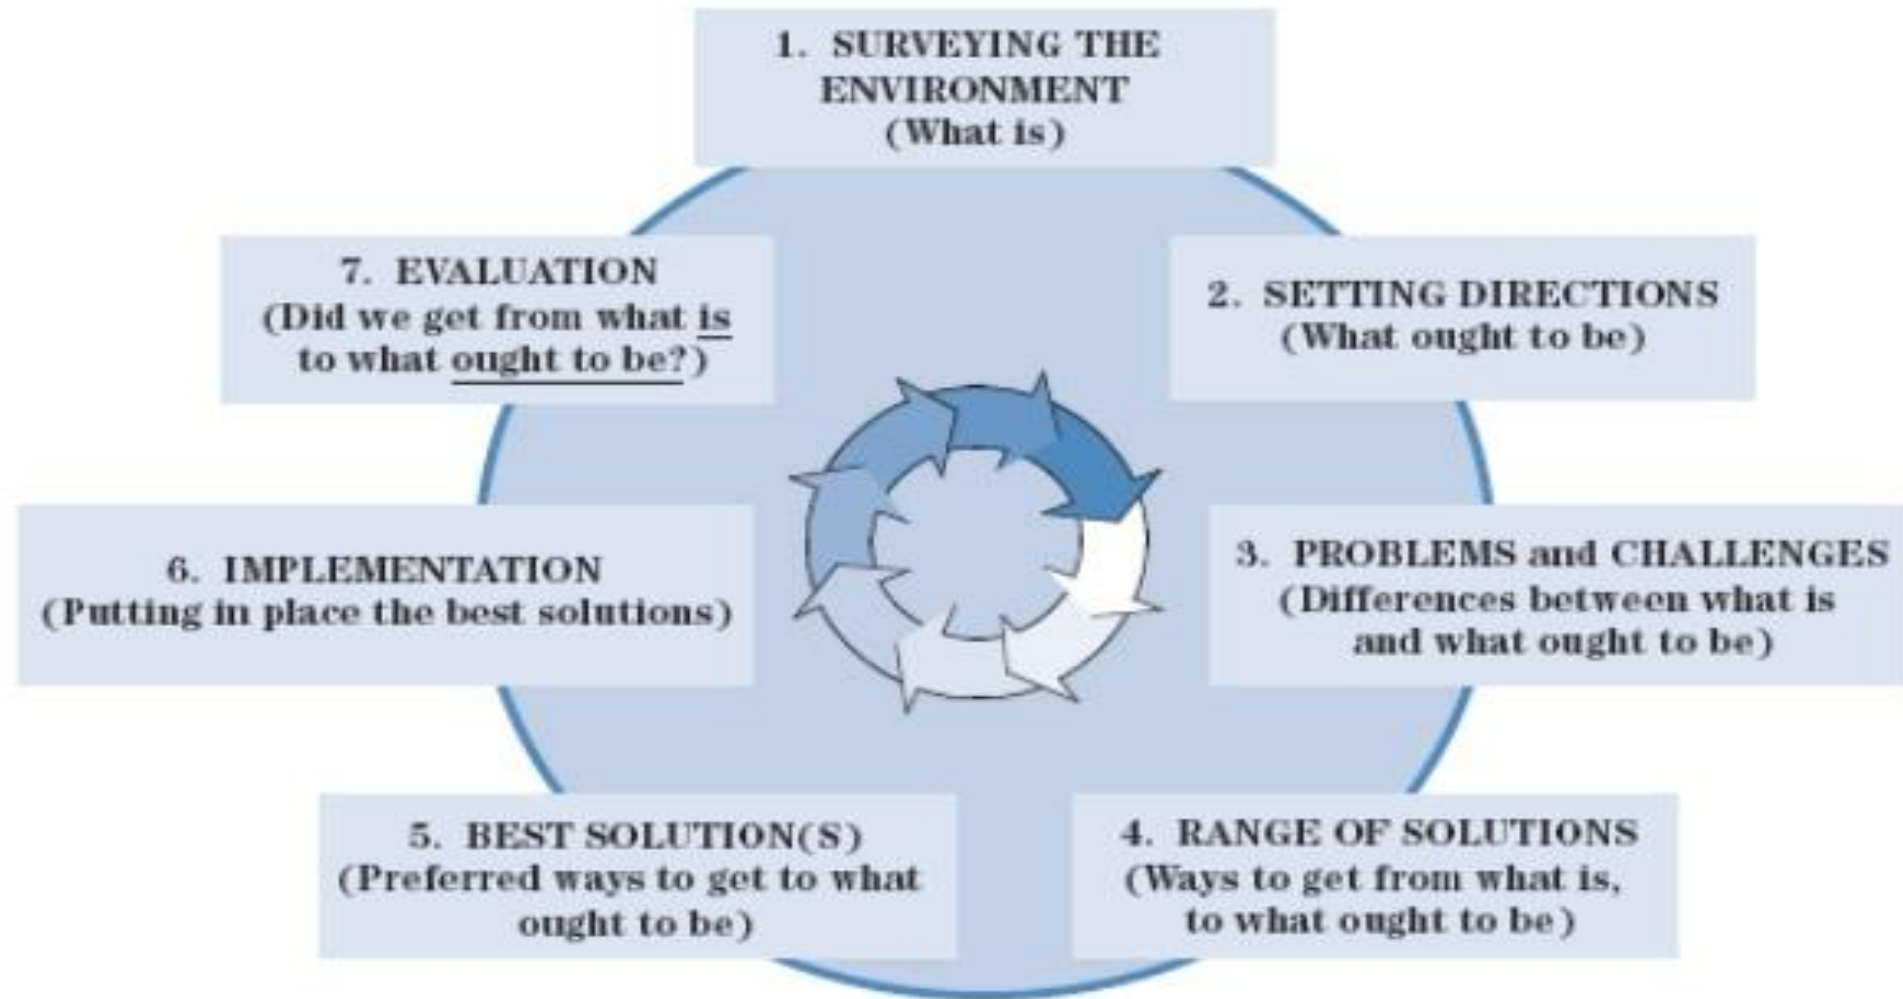

Figure – overview of various levels of service planning- Different planning formats

Figure 2: The Planning Cycle

Summary

Service planning describes the steps taken by health planners to move the service(s) of an entity, network or organisation into its desired future state.

Service planning is focused on improving the delivery of healthcare and begins with the identification of health service(s) of concern. Following a series of steps, health planners and managers can systematically achieve a well-informed and relevant service plan for implementation, and subsequent monitoring and evaluation.

Planning techniques to assist in service analysis, direction setting and implementation

- Service planning results in the development of a **definitive document containing the details of a service** to be implemented.
- The service planning process commences with identification of the service(s) under consideration; this is supported by identification of issues of concern or needs to be met for a selected population (Eagar et al., 2001).
- The timeframe for the plan is prescribed and related to the complexity and size of the proposal.

Work-based Learning

Class activity

- **Students should consider a service they consider relevant in their workplace and suggest how they can develop a plan to implement it**
- **Good place to end week one lesson.**
