

Task Description:

1. PDF Document:

- Create a PDF containing your character design process (from moodboard to sketches/explorations to the final design).
- It's enough to label the steps with numbers or headings or make one page per category.
- There doesn't need to be a lot of text.

2. Your Spine file and images folder:

- Include your full character rig and three animations (e.g., idle, walk, jump, or walk, dash, attack...).
- **Animations:**
 - Ensure that there is substantial movement in the animations (e.g., an idle animation should be more than just standing still and breathing, and a run animation should be more than just the legs jiggling around).
 - Use secondary motion and make sure the animations look believable, as if they were part of a game.
 - If in doubt, ask for clarification.

3. Rig Understandability:

- Make sure your rig is understandable by another animator or someone else:
 - Bones and constraints should have understandable names.
 - If your rig has overlapping bones, consider coloring them or giving them icons.
- It's fine if your rig has limits (e.g., meshes breaking if moved outside their intended area), but there should be no strange behavior, such as unparented attachments floating around.

4. Flaws in Animations:

- It's okay if your animations have some flaws – everyone is learning.
- Try to follow the animation principles discussed.
- Feel free to analyze rigs on eCampus, look at references, or use rotoscoping (e.g., tracing over a video).
