

Unit number: unit-title (template)

Example Assessment Brief

Student Name/ID Number	
Unit Number and Title	Unit 33 Construction Technology for complex Buildings
Academic Year	2025
Unit Tutor	
Assignment Title	Title Construction Technology for Complex building
Issue Date	
Submission Date	
IV Name & Date	
Submission Format	
The submission is in the form of a report and a presentation. The report should be technical and written in a concise and formal research writing and business style. As such, your choice of font face and font size should contribute to the clarity of the information. The report should be well structured, using headings, sub-sections and paragraphs as appropriate and should contain the appropriate drawings. Any images, graphics, or text that is derived from other sources must be correctly referenced using a standard form of citation. A bibliography should be included and in a standard academic format. Keep in mind that being clear and succinct are key features of professional documents. . The presentation which should be about 10-15 minutes to be presented before a nominated audience should be professional prepared in a standard and acceptable style. Your Report and the presentation should be submitted as a single of PDF document.	
Unit Learning Outcomes	
By the end of this unit, students will be able to: LO1 Discuss the characteristics of complex construction projects and their challenges. LO2 Define strategy for the preparation, materials and substructures for a given large-scale construction project. LO3 Develop an information package for the superstructure, building services and fire safety of a given large-scale construction project. LO4 Propose solutions that meet the requirements for safe demolition and disposal of materials for a large-scale construction project.	

Assignment Brief and Guidance

Scenario

You have been recently appointed as a graduate engineer in a design consultancy. Your employer has got a new project for the development of a mixed use 15 storey building with a basement to be used for car parking. The building will have two blocks. The ground floor to 4th floor of one block will be used for a hospital. 5th to 10th floor will be used for offices and the rest of the floors will be used for residential. The ground floor of the second block will be used for a retail store and a gymnasium. Rest of the building will be used for residential. The site for the building is a brown field. You have been asked to prepare a report considering the following and focusing on the given project.

Describe what makes the building complex and explain the structural needs of different types of complex construction projects. Also describe the safety, security and sustainability needs of different types of complex construction projects. Assess the relationship between structural solution and specialist technical requirements for different types of construction project by giving different examples. Analyse how complex projects may require additional levels of health and safety by giving examples and referring to the given scenario.

Examine existing site conditions and project information of the given complex project in the scenario to produce a list of information that will be required in the development of a strategy for the site preparation considering site safety, materials and substructure required. Using the information collected above, develop a strategy for the preparation of the site considering safe working, use of suitable materials and substructure required for a given complex building project.

Compare different approaches/strategies for material selection and construction method to determine their suitability for a given complex building project. Evaluate how an approach to largescale construction project superstructure will supports the approach to fire safety.

Compile drawings, specification and data to enable an information package for superstructure, building services and fire safety of a large scale complex project and Present it. Also discuss the ways in which fire safety is addressed in large-scale projects to meet statutory regulations.

Discuss different methods for demolition large-scale complex construction and their suitability for different types of project. Define a strategy for demolition of a large-scale construction project, (given scenario) including the transport and disposal of materials.

Analyse the importance of construction information in the process of preparing for and undertaking demolition works. Justify the need for reuse, reclamation or recycling during demolition to support sustainability through a building lifecycle.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Discuss the characteristics of complex construction projects and their challenges		D1 Analyse how complex projects may require additional levels of health and safety.
P1 Explain the structural needs of different types of complex construction projects. P2 Describe the safety, security and sustainability needs of different types of complex construction projects.	M1 Assess the relationship between structural solution and specialist technical requirements for different types of construction project.	
LO2 Define strategy for the preparation, materials and substructures for a given large-scale construction project		D2 Evaluate the ways in which an approach to large-scale construction project superstructure informs the approach to fire safety.
P3 Examine existing site conditions and project information to inform a strategy for site safety, preparation, materials and substructure. P4 Develop a strategy that provides for the preparation of the site, safe working, suitable materials and substructure for a given complex building project.	M2 Compare different approaches to material and construction method to determine their suitability for a given complex building project.	
LO3 Develop an information package for the superstructure, building services and fire safety of a given large-scale construction project		
P5 Compile drawings, specification and data to enable an information package for superstructure, building services and fire safety. P6 Present an information package for a large-scale project, including superstructure, building services and fire safety.	M3 Discuss the ways in which fire safety is addressed in large-scale projects to meet statutory regulations.	

Pass	Merit	Distinction
LO4 Propose solutions that meet the requirements for safe demolition and disposal of materials for a large-scale construction project		D3 Justify the need for re-use, reclamation or recycling during demolition to support sustainability through a building lifecycle.
P7 Explain the different methods for large-scale construction demolition and their suitability for different types of project. P8 Define a strategy for demolition of a large-scale construction project, including the transport and disposal of materials.	M4 Analyse the importance of construction information in the process of preparing for and undertaking demolition works.
